

AWS Class Notes – (27-Oct-2025)

Objective:

To revise about EC2 , SUDOsu and security group , working of internet protocol and use of subnets and about internet gateways.

Topics Covered (Revision):

- AWS EC2 installation launch is discussed
- EC2 key pairs and types and accessing ,usage is discussed
- Brief discription about Sodosu
- Discussion about vpc and internet protocol
- CIDR's ,public ip,private ip adresses,launching of applications
- Subnets and NAT usage

Trainer's Explanation:

Today's class was all about the internet protocol and usage of Sodosu accessing more permissons to launch an istance after creating an instance , key pairs, security goals, EC2 user , Sodosu - root vpc as default , ip address its bytes , what is region and global how to access regional (data centers) .VPC - networking ,connecting applications through DNS provided by ROUTE53 - Working of network is discussed -> routing,DNS,public IP, features,broadcast, launching an application and subnets access , NAT- to access private to public by using route table user - public subnet (vpc) - internet gateway - public EC2 - private - NAT (network address translator) Route Table access the information of private dubnet and changes to public subnet through NAT

Outcome:

Students revised about the steps to launch EC2 and understood the working of vpc for the internet protocol , learned about the key pair public key private key and usage of keys and conversions ,understood the networking connections and subnets also practised modules of creating and connecting of EC2
